ACADEMIC PRESS • New York • London

Table of Contents

Preface to First French Edition	v
Preface to English Translation	vii
Translator's Preface	ix
General Works on Tensors	xviii
CHAPTER I — General Remarks and First Examples	1
1. Introduction	1
2. The Role of Tensors and Their Usefulness	1
3. Some Examples of Tensors	3
4. The Stress Tensor in Elasticity	7
5. How the Stress Tensor Transforms under a Change of Cartesian Axes	10
6. Tensors of the Second Rank; Symmetry or Antisymmetry; Degeneracy	12
7. What Is a Matrix?	15
8. Different Reference Spaces; Affine Vector Space, Metric Space	17
9. Thermodynamic Diagrams as Examples of Affine Geometry .	20
CHAPTER II — Vector Geometry, Definition of Tensors	25
1. Axioms of Vector Geometry	25
2. Transformations of Rectilinear Axes	27
3. Covariance and Contravariance; Rectilinear Axes	30
4. Summations and Dummy Indices	33
5. Covariant Vector and Linear Form; Dual Space	34
6. General Definition of a Tensor	36
7. Methods of Forming Tensors; Operations of Elementary Algebra	38
8. The Contracted Product; A Criterion for Tensor Character . .	40
9. Examples: Force, Momentum, Velocity	42
10. Distinction between Tensors and Matrices	43

11. Curvilinear Coordinates	44
12. Symmetry and Antisymmetry	46
13. Examples of Antisymmetric Tensors Formed by Means of Vector Products. Exterior Products	49
14. Remarks on the Use of Tensors of Definite Symmetry and the Rule of Section 8	51
 CHAPTER III — Pseudo-Tensors in Vector Geometry; Tensor Densities and Capacities	 53
1. Types of Pseudo-Tensors and Their Use	53
2. Reduction of Antisymmetric Tensors to Pseudo-Tensors of a Different Rank; the Pseudo-Scalar	54
3. Another Example of a Pseudo-Scalar; Scalar Densities and Capacities	56
4. Tensor Densities and Capacities	57
5. Examples of Pseudo-Tensors; the Volume Element Represents the Typical Scalar Capacity	58
6. The Antisymmetric Tensor with Two Indices in Three-Dimensional Space Reduces to a Pseudo-Tensor	60
7. Summary of General Results	63
8. These Pseudo-Tensors Yield Axial Vectors in a Three-Dimensional Euclidean Space	65
9. General Method of Forming Pseudo-Tensors of the Two Types, Capacities or Densities	66
10. Examples of These Transformations	69
 CHAPTER IV — The Principal Differential Operators in Vector Geometry	 71
1. Introduction	71
2. The Ordinary Definitions of the Operators: Gradient, Curl Divergence, Laplacian Δ	72
3. Nature of the Precautions to be Taken	75
4. Gradient and Curl	76
5. Geometric Meaning of the Curl in Three Dimensions	79
6. The Curl in an Arbitrary Number of Dimensions	82
7. The Divergence Operator	84
8. Algebraic Confirmation of the Role of the Divergence.	86

9. The Divergence Applied to Tensor Densities of Rank Higher Than One	88
10. Examples of Divergences; Alternate Notation	89
CHAPTER V — Postulate of Parallel Displacement; Covariant Derivative in Affine Geometry	91
1. Method of H. Weyl	91
2. Postulate of Parallel Displacement: Affine Relationship, Geodesic Coordinates	91
3. Covariant Derivative of a Contravariant or Covariant Vector .	95
4. Covariant Derivative of an Arbitrary Tensor	98
5. Covariant Derivatives of Pseudo-Tensors	100
6. Remarks on the Divergences of Tensor Densities of Arbitrary Rank	102
7. Absolute Derivative of a Vector, Geodesic Lines	104
8. Displacement of a Quantity to a Finite Distance and Integrability Conditions	105
9. Finite Displacement of a Tensor, the Integrable Case	107
10. Displacement over a Closed Path of an Arbitrary Tensor or Pseudo-Tensor	111
11. Geometric Meaning of These Equations: Curvature of Space . .	112
12. A Space of Null Curvature is Linear	115
CHAPTER VI — Metric Geometry, Riemann Space	117
1. Elementary Definitions	117
2. General Definition; Fundamental Metric Tensor	118
3. Simple Examples. Curvilinear Coordinates in a Three-Dimensional Euclidean Space	121
4. Interpretation of the g_{ik} ; Their Geometric Meaning	125
5. Displacement of Indices; Covariant or Contravariant Components of the Same Vector or Tensor; Absolute Value; Scalar Product .	128
6. Geometric Meaning of These Operations; Components of a Vector along the Coordinate Lines and Perpendicular Projection . .	131
7. The Tangent Euclidean Space; Reduction of the Table g_{ik} to Diagonal Form	133
8. How Does the Determinant g Transform under Changes of Axes?	136
9. The Expressions $ g ^{1/2}$ and $ g ^{-1/2}$ as Types of Scalar Densities and Capacities	137

CHAPTER VII — Differential Operators and the Covariant Derivative in Metric Geometry	141
1. Extension of the Formulas of Chapter IV	141
2. The Laplacian Δ	142
3. Some Applications	144
4. Comparison of Ordinary Vector Notations and Tensor Notation; Essential Differences in the Definitions	145
5. The Problem of Displacement of Measuring Units; Gage Invariance	148
6. Covariant Derivative in Metric Geometry in Riemann Space. Christoffel Symbols	150
7. The Covariant Derivatives of the g_{ik} and of the Determinant g Vanish; All Scalar Densities or Capacities Have Vanishing Covariant Derivatives	153
8. Geometric Results and Meaning of the Rules of Parallel Displacement; Geodesic Coordinates	156
9. Properties of Geodesics; Minimum Length	157
10. Examples	161
11. Curvature of a Riemann Space. The Riemann-Christoffel Tensor	166
12. The Contracted Tensor of Ricci and Einstein and the Displacement of Pseudo-Tensors around a Closed Path	169
13. Bianchi's Identities	171
14. Normal Coordinates of Riemann; A Space of Null Curvature Is Euclidean	173
15. Riemann Curvature; Mean Curvature of Ricci	175
CHAPTER VIII — The Application of Riemann Geometries to Analytical Mechanics	177
1. Usefulness of Riemann Geometry in Classical Mechanics	177
2. d'Alembert's Principle	178
3. Lagrange's Equations	181
4. The Case of Time-Independent Constraints	183
5. Geometric Interpretation	184
6. Time-Independent Constraints with Potential Energy; How to Reduce a Mechanical Problem to a Search for a Geodesic	188
7. Geodesics in "Space-Time"; Allusion to Relativistic Mechanics	191
8. Time-Dependent Holonomic Constraints or Moving Reference Systems	194

9. Systems with Variable Constraints; Geometric Interpretation in Space-Time	197
10. Discussion and Examples	200
11. Lagrange's Principle of Least Action	206
12. Conservative Systems with Time-Independent Holonomic Constraints	211
13. Analytical Mechanics Compared with Geometrical Optics. Maupertuis' Principle and Fermat's Principle	215
14. Hamilton's Equations, General Form	217
15. Hamilton's Equations; Conservative Systems	222
16. Discussion and Examples	227
17. Some Consequences and Extensions of the Principle of Least Action	231
18. A Thermodynamic Analogy; Distinction between Heat and Mechanical Work	235
19. A Very Slow Transformation Leads to Boltzmann's Formula .	238
20. Adiabatic Transformation; Adiabatic Invariant of Ehrenfest .	240
21. Radiation Pressure	243
CHAPTER IX — The Transition to Wave Mechanics	247
1. The Introduction of Quanta into Physics	247
2. Energy, Frequency and Mass	248
3. Frequency Assigned to Hamilton's Waves; Wavelength and Momentum	250
4. Physical Optics and Geometrical Optics; Fermat's Principle .	253
5. Formation of a Wave Equation for Mechanics	258
6. General Method of Formation of the Wave Equation in Schrödinger's Mechanics	261
7. Commutation Rules	264
8. Propagation of a Group of Waves; Phase Velocity and Group Velocity	265
9. Groups of Waves in Space	270
10. Wave Groups in Wave Mechanics	274
CHAPTER X — Elasticity	277
1. Tensors in Elasticity	277
2. Review of Some Definitions	278

3. Elastic Stresses	281
4. Resultant Force on a Volume Element	284
5. Study of Deformations in Cartesian Coordinates	287
6. Strains. General Definition	292
7. Isotropic Body. Invariants of the Strain	296
8. Definition of a Potential Energy Density for a Strained Solid	299
9. The Elastic Coefficients; Voigt's Coefficients; Lamé's Notation. The Cauchy Relations	304
10. Relation between the Stresses and Strains	310
11. The Solid Medium in Motion; Euler's Coordinates	315
12. Example of the Study of a Body under an Initial Strain. Role of an Initial Internal or External Pressure on the Elastic Properties	317
13. Equations of Motion in Lagrange's Coordinates; Boussinesq's Formulas	323
14. A General Minimum Principle	327

CHAPTER XI — Elastic Waves in Solids

1. Propagation of Elastic Waves in a Crystal	329
2. Proper Vibrations of a Rectangular Parallelepiped; Cyclic Conditions	335
3. Reflection of an Elastic Wave at a Plane Surface	342
4. Enumeration of the Proper Vibrations of a Finite Solid	347
5. Direct Study of Interference and Standing Waves from Reflec- tion at Plane Mirrors	352
6. Proper Vibrations of a Solid Enclosed in a Rectangular Parallel- epiped with Smooth Rigid Walls	358
7. Influence of Higher Order Terms and Perturbations in Wave Propagation	364
8. Examples of These Secondary Effects in Traveling Waves	367
9. The Case of Standing Waves	370
10. Radiation Pressure of Standing Waves	372
11. The Calculation of Radiation Pressure by the Boltzmann- Ehrenfest Formula	378
12. The Radiation Stress Tensor of a Traveling Wave	380
13. Examples of Applications of These Tensors	384

14. Mean Values for Completely Diffuse Elastic Waves	388
15. Elastic Waves in a Fluid; Liquids as a Special Case of Solids .	393
16. Conditions for Measuring the Radiation Pressure at a Submerged Disk	398
17. What Can Be Said about the Elastic Coefficients A, B, C in the Second Approximation?	401

CHAPTER XII — Quantum Theory of the Solid State

1. Introduction; Analysis of Thermal Motion of Solids	405
2. Interpretation of the Thermal Expansion of Solids	407
3. Vibrations of a String with a Discontinuous Structure; Cutoff Frequency	410
4. Various Possible Extensions. Case of Vibrations of a Line of Atoms	414
5. Enumeration of Proper Vibrations. Transition to the Two- Dimensional Lattice	419
6. Three-Dimensional Crystal Lattice; Its Proper Vibrations . . .	422
7. Simplifying Hypotheses for an Isotropic Solid; Debye's Method .	427
8. The Quantum Theory of Thermal Motion in a Solid	431
9. Discussion; Comparison with Experiment	438
10. Radiation Pressure and Thermal Expansion of Solids	443
11. Comparisons with Experiment, Thermal Expansion	445
12. Thermodynamics of the Ideal Solid	448
13. Discussion and Review of Essential Points	452
14. Attempt to Extend the Theory to Liquids	456
